### DETAILED ACTION

1. Applicant's election of invention I, claims 1-10 is acknowledged. Claims 11-29 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim. Election was made **with** traverse in Paper filed 14 October 2003. Claims 1-10 are under examination.

Applicant argues that a burden of search is not present. However, because these inventions are distinct for the reasons given is the Restriction requirement and have acquired a separate status in the art because of their recognized divergent subject matter, restriction for examination purposes as indicated is proper.

### *Claim Rejections - 35 USC § 102*

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(c) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1-3 and 8-10 are rejected under 35 U.S.C. 102(e) as being anticipated by Glucksmann *et al.* (US 2001/0044130). Glucksmann *et al.* teach the 39406 polypeptide (including variants and fragments) which contains seven transmembrane regions (regarding claims 1(a), 2). The reference teaches 39406 polypeptide fusion proteins which include enzymatic fusion proteins, for example beta-galactosidase fusions, yeast two-hybrid GAL-4

fusions, poly-His fusions and Ig fusions (see section [0089]; regarding claims 1(c), 3, 8). The reference teaches that these fusions should be operatively linked to the 39406 protein and may be fused to the N- or C-terminus, with the C-terminus being intracellular (see section [0088]; regarding claims 9-10). The 39406 polypeptide possess extracellular loops, not at the amino terminus, that are used to make antibodies (see section [0084] and definition of sorting segment at page 6, line 18; regarding claims 1(b)). Thus, the reference anticipates the claimed invention.

4. Claims 1-10 are rejected under 35 U.S.C. 102(e) as being anticipated by Bogan *et al.* (US 6,303,373). Bogan *et al.* teach a modified GLUT4 reporter (possessing at least 2 transmembrane domains) containing myc epitope tags in the first extracellular loop (not amino terminus) and GFP in frame at the carboxy terminus (intracellular)(see figure 1a and paragraph bridging columns 9-10); regarding claims 1-3 and 5-10). Bogan *et al.* Teach that the myc epeitope itself may be detectably labeled by avidin, placing avidin in the sorting segment as required by claim 4 (see paragraph bridging columns 9-10). Thus, the reference anticipates the claimed invention.
